Project Title: COURIER MANAGEMENT SYSTEM

Project Overview

The Courier Management System is a web-based application designed to streamline the process of sending and tracking packages. By leveraging modern technologies such as HTML, CSS, Bootstrap, JavaScript for the frontend, and PHP and MySQL for the backend, this system provides an intuitive user interface for both customers and couriers. Users can easily register, log in, and manage their shipments, while couriers can efficiently track packages and update delivery statuses. The application aims to enhance user experience through real-time notifications and package tracking, ensuring timely and reliable delivery services. Ultimately, this project seeks to improve the overall efficiency of courier operations and enhance customer satisfaction.

Objectives

- Enable users to securely register and log in to access personalized features.
- Allow users to create, view, and manage their shipments with ease, including tracking and status updates.
- Develop a backend system to efficiently manage package data, track couriers, and monitor system performance.
- Enable users to provide feedback on their experience, facilitating continuous improvement of the service.
- Provide features like sorting and filtering complaints by date, distance, category.

Key Features

For Candidates:

1. Account Login: Customers must log in using their credentials, ensuring only verified users can access their shipments and personal data.

2. Profile Management: Customers can create and update their profiles, including personal details, contact information, and default addresses for shipping.

3. Shipment Tracking: Browse and filter shipment status updates based on criteria such as package ID, destination, or delivery date, giving customers full visibility of their shipments.

4. Create New Shipments: Easily create new shipment requests by entering package details, pickup and delivery addresses, and selecting delivery options.

5. Edit Personal Information: Customers can update their personal information, such as name, address, and contact details, ensuring their profile is always accurate and up-to-date.

For the company

1. View All Shipments: Admins can view a comprehensive list of all shipments through the system, including details like sender, recipient, courier, package status, and delivery time.

2. Create Courier Assignments: Admin users can assign couriers to specific shipments with detailed information such as pickup location, delivery destination, and estimated delivery time.

3. Edit/Delete Shipment Records: Modify or remove shipment records as needed, allowing flexibility in managing delivery operations and correcting errors.

4. Filter and Sort Shipments: Admins can filter, and sort shipments based on criteria like status (in transit, delivered, pending), courier assigned, delivery date, or package type.

5. Shipment Status Management: Admins can set and update the shipment status (pending, in transit, delivered) and ensure accurate tracking of delivery progress throughout the system.

Technology Stack

Frontend:

- **HTML5:** Semantic markup and structure for optimal performance and accessibility.
- **CSS3:** Advanced styling, animations, and responsive design techniques for a polished UI.
- **Bootstrap:** Utilized for rapid development of responsive, mobile-first websites with an extensive library of pre-built components.
- **JavaScript :**Implementing dynamic interactions and functionality, including DOM manipulation and event-driven behaviors.

Backend:

- **PHP (Hypertext Preprocessor):** Server-side scripting language to handle backend logic, form processing, and API integration.
- **MySQL:** Efficient database management for storing, retrieving, and manipulating data securely.

Conclusion

In conclusion, the proposed Courier Management System aims to streamline the process of sending, tracking, and managing shipments through an intuitive, user-friendly platform. By leveraging modern web technologies like HTML, CSS, JavaScript, PHP, and MySQL, the

system will enhance operational efficiency for the company while improving the overall user experience for customers. This project will provide secure, scalable, and reliable courier services, ensuring timely deliveries and customer satisfaction.
